

COMBINATION OF AIR REFRESHER AND ELECTRONIC APPLIANCE HOLDING DEVICE

ABSTRACT OF THE DISCLOSURE

A holding device is composed of a base and a cover . An air refresher is positioned in a receiving portion of the device and an electronic appliance is clamped between two clamping plates on two sides of the device. A sliding mechanism is received in the device and includes a gear that drives a sleeve to which a core of the air refresher is connected. A fan is located in the device so as to dispense the fragrance through holes defined through the base and the cover.
